

## STARK COUNTY INFLUENZA SNAPSHOT, WEEK 52

Week ending December 31, 2011, with updates through 01/07/2012.

All data are preliminary and may change as additional information is received.

NOTE: Compilation of multiyear averages does not include the 2009/2010 H1N1 season.

During week 52, (Dec 25, 2011 – Dec 31, 2011) overall Influenza-Like-Illness activity displayed increasing seasonal trends, however indicators of severity remained low.

- No Hospitalizations or medically/laboratory reported cases of influenza were reported in Stark County residents during week 52. A total of 3 hospitalizations have been reported this season. (Graph 1)
- Demographics for the 3 influenza-associated hospitalized cases during the 2011-2012 season in Stark County: the age range is 62 - 87years with a **median of 80 years**. With only 3 reports this season, 100% reported their race as Caucasian.
- Those that sought medical treatment and did not require hospitalization were primarily young, and those requiring hospitalization were primarily the aged in our community.
- Among the five cases of influenza identified in Stark County, three have been type B, one was Type A (H3) and the 5<sup>th</sup> was Type A with unknown characterization. (See Graph 2) The CDC has antigenically characterized 129 influenza viruses since Oct 1, 2011: 14 (11%) 2009 influenza A (H1N1), 104 (**81%**) influenza A (H3N2) viruses, and 11 (8%) influenza B viruses (7 Victoria Lineage which is a part of this seasons vaccine and 4 of the Yamagata Lineage). It is too early to determine how well the seasonal vaccine and circulating stains will match.
- Week 52 National indicators of outpatient activity of influenza-like-illness (ILI), as reported by Sentinel Providers, **increased** to 1.7%. The National outpatient activity level is below the epidemic baseline of 2.4%. Region V of the US, which includes OH and IL, IN, MI, MN, and WI, is now reporting **elevated** levels of outpatient activity for ILI. Stark County Sentinel Providers reported a **slight increase** to 1.08% of patients with ILI. (Graph 3)
- Emergency Department visits specifically for symptoms consistent with Constitutional and Respiratory (C & R) syndrome and ILI + Fever continued their seasonally predicted trends. Currently 34% of all visits by Stark County Residents are for symptoms consistent with C & R Syndrome. Note: During 2011, Aultman and Mercy stat cares were added as a data source. These stat cares have historically seen more patients for C & R & ILI + Fever syndromes than their main hospital counterparts. Therefore an overall increase in volume and percentage of patient visits over the previous year's average is expected.(Graph 4)
- Over-The-Counter (OTC) cough and cold product sales **increased** more than 20% from the previous week and Thermometer sales had small but increased sales. Both of these OTC products remain below baseline levels and are following seasonally expected trends. (Graph 5)
- Due to winter holidays there was no school absenteeism reporting for CDC week 52.(Graph 6)
- During week 52, the State of Ohio and 39 other states reported "**Sporadic**" influenza activity. (Sporadic activity is defined as small numbers of laboratory-confirmed influenza cases or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI). One state, Colorado, reported Regional ILI activity, and four states, Massachusetts, New Hampshire, Texas, and Virginia, reported Local influenza activity. No states reported Widespread geographical influenza activity. (See Map)
- During CDC Week 52 , National Pneumonia and Influenza (P & I) Mortality Surveillance of all deaths reported through the 122 Cities Mortality Reporting System as due to P & I, **decreased** to 7.0%. This is below the P & I epidemic threshold, now at 7.5%.
- Nationally, **no** influenza-associated pediatric deaths have been reported to the CDC this season

**Graph 1: Influenza Cases reported to Local Health Departments** Note, Influenza is only reportable if associated with a hospitalization; therefore, this only represents a small number of actual influenza cases in Stark County.

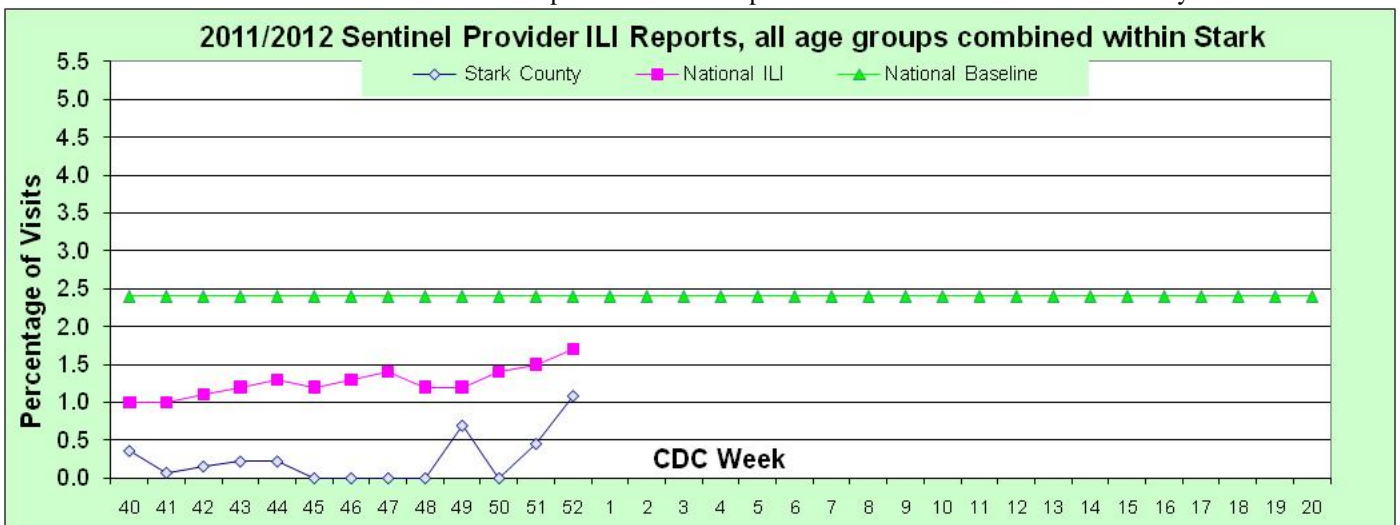

**Graph 2: Stark County Influenza Type, by CDC Week in Stark County.** The graph depicts the number of cases reported with hospitalization and by the medical community combined, per CDC week. All cases are Stark County residents.

**Graph 3: Sentinel Provider Reported Influenza-Like-Illness in Stark County**

Sentinel Providers-An influenza sentinel provider conducts surveillance for influenza-like illness (ILI) in collaboration with the state health department and the Centers for Disease Control and Prevention (CDC). Data reported by Stark Counties 4 providers are combined with other influenza surveillance data to provide a national picture of influenza virus and ILI activity.

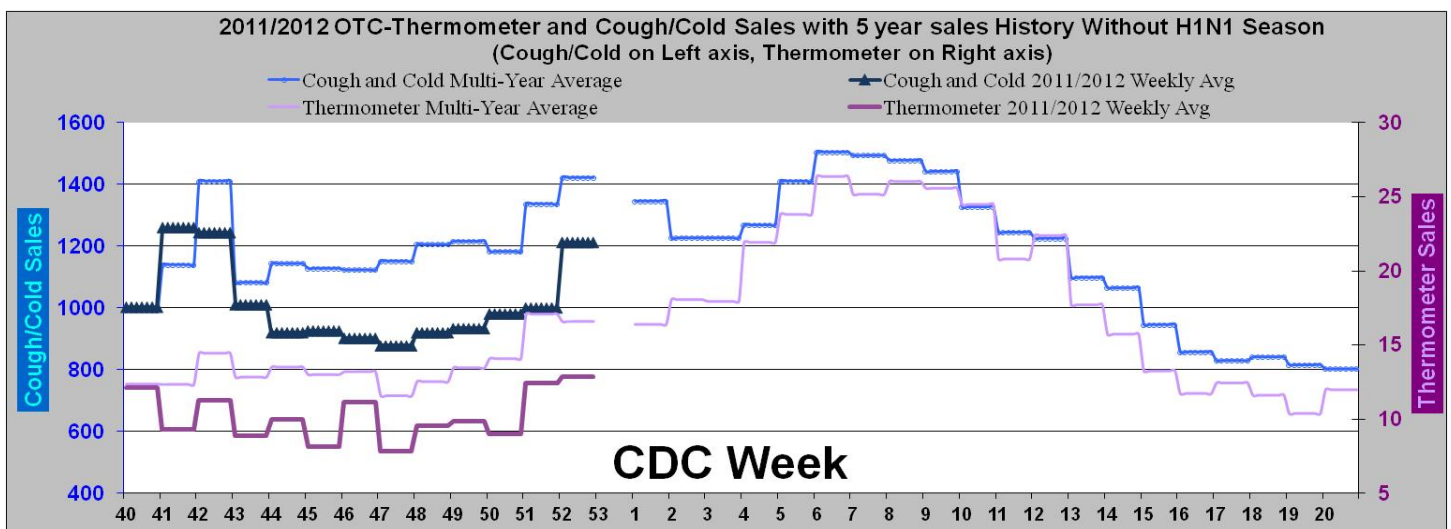

**Graph 4: Emergency Department Visits for combined Respiratory and Constitutional Syndromes**  
 (Source Health Monitoring Systems, EpiCenter, hospital and stat care patient registration surveillance system)  
 (Note a loss of data was observed from 3 small facilities during CDC weeks 42-46)

## Sources of Influenza Surveillance Data

Six types of data sources are examined on a weekly basis to help paint a picture of influenza activity in our community:

- **Emergency Department Visits (EpiCenter):** EpiCenter collects emergency department chief complaint data from 4 hospital facilities and 5 Stat Cares across Stark County in real time and classifies them into symptom and syndrome categories. Chief complaints from the combined constitutional and respiratory syndrome category and the fever + ILI symptoms classifier are analyzed for influenza surveillance. Secure sign in source: <https://epicenter.hmsinc.com/epicenter/login.html>.
- **National Retail Data Monitor (NRDM)-OTC Drug Purchases:** The NRDM collects over-the-counter (OTC) drug sales information from approximately 1,420 Ohio chain drug stores and grocery stores. For influenza surveillance, thermometer and adult cold relief sales are monitored on a weekly basis from sales in Stark County. Secure sign in source: <https://www.rods.pitt.edu/rods3/>.
- **Sentinel Providers (ILINet):** Sentinel providers, through the US Influenza-like Illness Surveillance Network (ILINet), collect outpatient ILI data. Providers report the total number of patients seen and the number of patients with ILI by age group on a weekly basis. Sentinel providers also submit specimens for influenza testing to the ODH laboratory throughout the influenza season. There are 68 sentinel providers enrolled in Ohio and 3 in Stark County for the 2011-2012 season. Source: Ohio Department of Health Influenza Surveillance Coordinator.
- **ODH and Local Laboratory Surveillance:** The Ohio Department of Health Laboratory reports the number of specimens that test positive for influenza each week. Generally, specimens are submitted by sentinel provider participants. A subset of the positive specimens is sent to CDC for further testing during the season. Laboratory reports from larger physician practices and hospital laboratories in the county are voluntarily submitted each week to the four health departments. They may include age, zip code, and race and help to describe the demographic pattern of illness and type of influenza circulating in the community. Source for ODH information: <http://www.odh.ohio.gov/features/odhfeatures/seasflu/ohfluactivity.aspx> and individual medical and laboratory reports.
- **Influenza-associated Hospitalizations (ODRS):** Influenza-associated hospitalizations are reported to the four local health departments and hospitals by direct entry into the Ohio Disease Reporting System (ODRS). Hospitalizations can be used as an indicator of the severity of illness during a particular influenza season. This condition became reportable in 2009. Secure sign in source: <https://odhgateway.odh.ohio.gov/singlesignon/>.
- **School Absenteeism, total and ILI:** Numerous school systems of various sizes in Stark County report the number of students absent for medical reasons and for specific medical conditions including ILI. Increases in school absenteeism for ILI are often an early indicator to larger community trends. Source: Individual school reporting.
